

WHAT IS CLAIMED IS:

1. A multimedia providing system, comprising:
a server capable of transmitting multimedia content onto the Internet;
a multimedia conversion server capable of obtaining the multimedia content and retransmitting the content to the outside of the Internet; and
a multimedia terminal capable of obtaining the multimedia content retransmitted and providing the content for a user to use the content, wherein
the multimedia conversion server includes
first access means for accessing the server through the Internet,
first obtaining means for obtaining markup language and multimedia content from the server,
converter means for converting the markup language and the multimedia content obtained by the first obtaining means, into a format suitable for communication with the multimedia terminal, and
transmitter means for retransmitting the markup language and the multimedia content to the multimedia terminal, and
the multimedia terminal includes
second access means for accessing the server through the multimedia conversion server,
second obtaining means for obtaining the markup language and the multimedia content retransmitted, and

display means for displaying the multimedia content obtained by the second obtaining means, in accordance with the markup language obtained by the second obtaining means.

obtaining means for obtaining markup language and multimedia content from the server;

transmitter means for retransmitting the markup
15 language and the multimedia content converted, to the
multimedia terminal.

access means for accessing a server on the Internet through a multimedia conversion server;

display means for displaying the obtained
multimedia content in accordance with the obtained
25 markup language.

content onto Internet;

a multimedia conversion server capable of obtaining the multimedia content and retransmitting the content to the outside of the Internet; and

a multimedia terminal capable of obtaining the multimedia content retransmitted and providing the content for a user to use the content, wherein

the multimedia conversion server includes
first access means for accessing the server
through the Internet,

first obtaining means for obtaining markup
language and multimedia content from the server,
separator means for separating video information
from the multimedia content obtained by the first
obtaining means,

synthesizer means for synthesizing the separated video information and the markup language obtained by the first obtaining means to attain an image,

of the multimedia terminal from the multimedia terminal,
and motion means for moving a position of the cursor
drawn, in accordance with the instruction received,

the converter means converts the image on which
5 the cursor is drawn, in place of the synthesized image,
and the obtained multimedia content, into a format
suitable for communication with the multimedia terminal,
and

the multimedia terminal further includes input
10 means for inputting an instruction of a user, and
transmitter means for transmitting the inputted
instruction to the multimedia conversion server.
